VITAL STATISTICS, 1911.

FIFTY-SECOND ANNUAL REPORT

OF

THE GOVERNMENT STATISTICIAN.

THORNHILL WEEDON, Fellow Royal Statistical Society, London, GOVERNMENT STATISTICIAN.

PRESENTED TO BOTH HOUSES OF PARLIAMENT BY COMMAND.

BRISBANE:

BY AUTHORITY: ANTHONY JAMES CUMMING, GOVERNMENT PRINTER, WILLIAM STREET.

Though Thuma Grooms-Main

HER GOVERNMENT STATISTICIAN.

THORNWAL WELLOW, I word Engel Desiried Section Lander,

FIFTY-SECOND REPORT OF THE GOVERNMENT STATISTICIAN ON THE VITAL STATISTICS OF QUEENSLAND.

TO THE UNDER SECRETARY, HOME DEPARTMENT, BRISBANE.

In submitting my Report on the Vital Statistics of the State for 1911, I am once again—being the third consecutive occasion—in a position to express satisfaction at the experience.

The increase in the population was numerically the largest accretion recorded for 24 years, whilst the ratio of increase had not been exceeded since 1889; nor was this result due to migration alone, for the natural increase was greater than ever previously experienced. The birth registrations were in excess of those for any previous year; and although the number of deaths was somewhat high yet this number had been previously exceeded on one occasion (1884.)

Marriages celebrated were some 400 more than ever before, although 1911 was the third consecutive occasion upon which a record in this respect had been established.

POPULATION.

A census of the population having taken place during 1911, it may not be out of place before proceeding with subsequent events to place on record a few of the facts as ascertained at that enumeration, so far as the tabulations made by the Commonwealth Statistician are available.

The census was taken on the 3rd April, when the population of Queensland, exclusive of full-blooded aboriginals, was found to comprise 605,813 persons (males 329,506, females 276,307).

Compilation of census results has so far advanced as to render available the principal figures relating to population in localities by sex. The numbers of the people at each year or year group of life, as well as the birthplaces and religions of all males and females in the State, are available; and in Appendix C will be found tables furnishing somewhat full details under these heads, and summaries of these are presented in the body of this Report.

Local Government.

The number of males in each city, town, and shire of the State will be found at Appendix C. Table I. The following statement summarises this:—

A. LOCAL GOVERNMENT.

				Males.	Females.	Persons.
Cities Fowns Shires Not Incorporated Shipping	•	 	 	 68,611 44,879 211,453 1,267 3,296	72,954 45,639 156,840 302 572	141,565 90,518 368,293 1,569 3,868
T	otal	 	 	 329,506	276,307	605,813

Of the 605,813 persons in Queensland, 141,565 were found in the 9 cities of the State, 90,518 being located in the 24 towns and 368,293 in the shires, leaving 5,437 persons outside any form of local government, 3,868 on board ship, and 1,569 on territory not incorporated. Assuming the population of the shires as representing those living under rural conditions—a reasonable assumption—as those living in townships in shires would be balanced by residents of rural areas within city and town boundaries—then the urban and rural populations, respectively, comprise 38.7 and 61.3 per cent. of the total population.

The figures in Appendix C, Table I., relate, as the heading shows, to local authorities; and consequently take no count of the metropolitan area as such. Greater Brisbane consists of the cities of Brisbane and South Brisbane, the towns of Hamilton, Ithaca, Toowong, Windsor, and part of Sandgate, as well as the whole of 7 and parts of 7 other shires. Exclusive of shipping, these had at the census a combined population of 139,480 persons, of whom 67,628 were males and 71,852 were females.

Ages.

In the Appendix C, Table II., details as to ages are given for the metropolitan area as well as for the whole State in quinquennial groups. The following statement contains a brief summary of the table:—

B. AGES.

Ages.			Males.	Femules.	Persons.
Under 1 year 1 year and under 5 years	•••		 8,329 29,395	7,967 28,013	16,296 57,408
Total under 5 years			 37,724	35,980	73,704
5 years and under 15 years 15 years and under 21 years	•••		 63,522 39,532	62,413 37,160	125,935 76,692
Total under 21 years			 140,778	135,553	276,331
21 years and under 45 years 45 years to 75 years and up Unspecified		•••	 121,711 65, 0 35 1,982	97,277 42,293 1,184	218,988 107,328 3,166
Total State			 329,506	276,307	605,813

Of the total population, 2.69 per cent. were under 1 year of age; 12.17 per cent. under 5 years of age; and 45.61 per cent. under 21.

BIRTHPLACES.

For particulars as to the birthplaces of the people as returned on the census schedules, reference can be made to Table III. in Appendix C. Of the total population, 446,695, or 73.73 per cent., were natives of the Commonwealth and 19.84 per cent. persons born in the United Kingdom. The alien element of all kinds as regards birth numbered 32,360, or 0.53 per cent. of the population. Many of these were, however, no doubt naturalised British subjects.

RELIGION.

The following is a summary of the details given in Appendix C, Table IV., and gives the totals of the seven chief religious denominations:—

C.
RELIGIONS.

	Religi	ons.			Males.	Females.	Persons.
Church of England					 114,958	97,744	212,702
Roman Catholic					 71,623	65,463	137,086
Presbyterian		•••			 40,894	34,666	75,560
Methodist					 30,309	29,611	59,920
Lutheran					 13,038	11,197	24,235
Baptist					 6,665	7,050	13,715
Congregational					 5,137	5,308	10,445
Other Christian		•••			 23,305	18,856	42,161
Total Christian	•••			•••	 305,929	269,895	575,824
All other			(+ 4		 23,577	6,412	29,989
Tot	al				 329,506	276,307	605,813

The ratios to the total population of the four principal sects were—Church of England, 35.11 per cent.; Roman Catholic, 22.63 per cent.; Presbyterian, 12.47 per cent.; and Methodist, 9.89 per cent.

The census having definitely determined the population to 3rd April, 1911, obviously subsequent estimates start from that date. To facilitate estimation, a retrospective estimate to the 1st of that month has been formulated; and all future estimates until the next census will start as from the latter

date. For migration statistics this Bureau is dependent on Commonwealth figures. Steps have now been taken to collect interstate migration for Queensland, which will enable a check to be applied to the figures collected by the Customs Department. The following table furnished an estimate of the growth of the population from 1st April to 31st December, 1911:—

A.

Mean Population for the Year 1911							334,542	279,810	614,352

⁺ Including allowance for unrecorded oversea departures.

The population of Queensland on 1st April, 1911, consisted of 329,426 males, 276,238 females, and 605,664 persons. There were 4,223 births registered during the June quarter and 1,653 deaths, resulting in an accession to the population during that quarter from natural increase of 2,570 persons. Excess of immigration over emigration for the same period, plus a special allowance of 250 estimated by the Commonwealth Statistician as due to this State, added 8,978 more to the population, bringing the number of persons in the State on 30th June, 1911, to 617,212. Following for the next two quarters a like method of estimation, the population on 31st December, 1911, was found to be 622,129 persons, of whom 337,955 were males and 284,174 females.

The population increase for the year of 22,398 has only twice previously been exceeded—namely, in 1883 and 1887. The centesimal ratio of increase for the year was the best recorded since 1889, for, although the figures given for 1890 also exceeded those for 1911, it has to be borne in mind that the latter was shown by the census taken in 1891 to have been in excess.

The ratios of increases of population in each State of the Commonwealth between the date of the census taken on 3rd April, 1911, and the 31st December, the same year, were as follow:—

			Aa.			
Queensland	 	2.69		Western Australia	 	4.28
New South Wales		1.58		Tasmania]	 	1.19
Victoria	 	3.59		New Zealand	 •••	1.68
South Australia	 	2.35				

⁻ Excess of Departures.

Queensland stands third on the list with an increase for the nine months of 2.69 per cent., this being exceeded by Western Australia 4.28 and Victoria 3.59.

The estimated population of each State of the Commonwealth on 31st December, 1911, along with other correlated information, is furnished in the following table:—

6 7 -	
EA IN	١.

		earga				
9 3 8 5 5 State.	Estimated P	opulation, 31st De	of each sex in he Population.	Proportion per cent, of the Population of each Federal State to the total Popu-

South Australia	212,650	205,522	418,172	50.85	49.15	9.15
Western Australia	168,094	126,087	294,181	57.14	42.86	6:44
Tasmania	98,594	94,885	193,479	50 96	49.04	4.24
Territories-						
Northern Territory	2,662	586	3,248	81.96	18.04	0.02
Federal Capital Territory	1,068	853	1,921	55:60	41:40	0.04
Total Commonwealth	2,377,920	2,190,787	4,568,707	52.05	47.95	100:00
New Zealand	539,729	485,677	1,025,406	52.64	47:36	
Total Australasia	2,917,649	2,676,464	5,594,113	52·16	47.84	

The total population for Australia and New Zealand now numbers 5,594,113 persons; of these 4,568,707 persons comprise the population of the Commonwealth.

Of the population of Australia slightly over 1 person of each 1,000 are found in the territories taken over by the Commonwealth. New South Wales contains 37 per cent. of the whole; Victoria, 30 per cent.; Queensland, 14 per cent.; South Australia, 9 per cent.; Western Australia, 6 per cent.; and Tasmania, 4 per cent.

Throughout the Commonwealth and in each State males predominate, there being 52 males to 48 females throughout Australia. Equality of sex proportion nearly obtains in several States—in Tasmania, South Australia, and Victoria the difference is less than 1 in each 100. For New South Wales the ratio is almost precisely that for the whole Commonwealth—, namely, 52 to 48. Queensland comes next with 54 to 46, followed lastly by Western Australia, where there are 57 males to each 43 females.

The proportion of women in Queensland has gradually risen with her advancement as a separate State.

				Ac.		
				Males to each 100 Persons.	Females to each 100 Persons.	Females to each 100 Males.
1880	 	 		58.71	 41.29	 70.32
1885	 	 •••		58.91	 41.09	 69.75
1890	 	 	•••	56.93	 43.07	 75.65
1895	 	 	•••	56.27	 43.73	 77.71
1900	 	 		55.63	 44.37	 79.77
1905	 	 		54.96	 45.04	 81.96
1910	 	 		54.38	 45.62	 83.89
1911	 	 		54.32	 45.68	 84.09

Prior to 1885 the ratio fluctuated, receding before each wave of immigration which for the most part comprised more males than females. The population at that time being a limited one, the volume of immigration was sufficient to affect the balance of the sexes. The following table is designed to show the part played since the foundation of Queensland by each of the two sources of population accession—Natural Increase and Migration:—

Ad.

^{*} Figures adjusted after actual population ascertained by census. § Including allowances for unrecorded arrivals and departures. — Excess of departures.

A table covering 50 yearly records was found too cumbersome; consequently the information is now given in quinquennial rests.

The first line covers 4 years only—1862 to 1865. This was a period of great migration activity, excess of immigration providing 90 per cent. of the total increase. During the following five years migration contributed 51 per cent., and excess of births over deaths 49 per cent. of the total increase. During 1871-5 immigration again came to the front, the proportions to the increase were excess of arrivals 74 per cent. and natural increase 26 per cent. During the following 15 years migration still largely predominated, the ratios per cent. being 77 migration and 23 natural increase. From 1890 up to last year excess of births has been the chief contributing factor; the centesimal ratio of increase furnished by each being excess of births 70 and excess of arrivals 30. Last year migration was once again in the ascendant with the result that natural increase supplied 45 per cent. to the increase of population and migration 55 per cent.

The last column of the foregoing table illustrates the fluctuation in sex proportion brought about according as natural increase or migration was the chief factor in population accretion.

Migration.

Immigration and emigration for 1911 as recorded by the Commonwealth Statistician are shown in the following table:—

N.B.—This table does not include the allowances made in framing population estimates for persons crossing the Border otherwise than by Rail,

The arrivals and departures by land represent only those who travel by train. These are carefully counted at each crossing place by an officer of the Railway Department—for this service a payment is made by the Commonwealth to the Department—and no doubt this information is as accurate as it is possible to be. The sea-wise traffic is, I consider, less reliable. The practice adopted by the Commonwealth Statistician of counting only arrivals into each State and from these deducing the departures from other States is, to my mind, most unsatisfactory, and will never, I believe, secure accurate results. However, at present I have no other source of information and can only accept what is furnished.

Accepting the figures for what they are worth, there were 109,720 persons who arrived in this State during 1911, and 97,560 who departed, leaving a balance in favour of immigration of 12,160 persons. During the first quarter of the year there was a gain of nearly 4,000; in the second quarter of nearly 9,000; and in the third quarter of rather more than 3,000, aggregating in all 16,000, but during the last quarter of the year some 4,000 more persons departed from Queensland than arrived therein. This was in accordance with usual experience, large numbers of holiday-makers proceeding South for the summer months.

Population in Financial Divisions.

As the boundaries of the financial divisions are not quite coterminous with groups of census districts, exact figures on this head are not procurable; but careful adjustments have been made where necessary, and the figures in the following table may be taken as substantially correct:—

						(C.			
							Northern Division.	Central Division.	Southern Division.	Total State.

	Total Pers	sons				•••	121,708	74,669	425,752	622,129

Some considerable alterations as to the population in each division was disclosed by the results of the last census enumeration when compared with those for 1901. The population in the Southern Division has increased at a considerably greater rate than in either the Northern or Central Division. The proportion of the total population found in each was as follows:—South, 68 per cent.; North, 20 per cent.; and Central, 12 per cent.

Population-Metropolitan Area.

The population of Greater Brisbane on the 31st December, 1911, was estimated at 143,514 persons. The following statement gives somewhat fuller details:—

		D					
					Males.	Females.	Persons.
City of Brisbane	•	•••			19,916	20,338	40,254
City of South Brisbane .		•••	,		15,042	16,338	31,380
Suburbs		21+	•••		35,187	36,693	71,880
Brisbane Metropoli	tan Area	(Ten-mi	le Radi	us)	70,145	73,369	143,514

Greater Brisbane is taken on a 10-mile radius, and therefore embraces an area of 195,277 acres. It comprises the cities of Brisbane (3.520 acres) and South Brisbane (2,880 acres), and either the whole or part of several municipalities and shires. These are designated "suburbs," and in the aggregate they represent an area of 188,877 acres. Taking the populations allotted to each section of the metropolitan area in the preceding table, the density of population is found to be 11.4 persons to each acre in North Brisbane, 10.9 persons to each acre in South Brisbane, and 0.38 of a person to each acre in the suburbs.

Federal "Effective" Population.

The "effective" population of a State is that portion of the population which is statutorily countable towards representation in the Legislative Asembly of the Commonwealth Parliament.

Da.

	State.				Effective		Quotient an	nd Remainder.	Number of Representatives.		
					Population 3rd April, 1911.	Quota.	Quotient.	Remainder.	Number as per Quota.	Statutory Number.	
									: (1)	h and	
Queensland					594,514		9	40,591	10	10	
New South Wales					1,646,734		26	46,512	27	27	
Victoria					1,315,551	61,547	21	23,064	21	21	
South Australia					408,558	01,047	6	39,276	7	7	
Western Australia					274,841		4	28,653	4	5	
lasmania					191,211) (3	6,570	3	5	
Commonwea	lth				4,431,409					75	

In four of the six States the "effective" and the actual population are one and the same. The exemptions from the latter consist of any persons of an alien race who at the time of Federation were specially debarred by State statute from qualifying as electors of such State.

In two States—Queensland and Western Australia—such a statutory provision was in existence, the result being that 11,299 persons for Queensland and 7,273 for Western Australia are deducted in the above table from the actual populations, so as to arrive at the "effective" population.

MARRIAGES.

Very copious tables will be found printed as an Appendix to this Report dealing with all subjects relating to Vital Statistics. At Table No. IV. the number of marriages celebrated during 1911 in each registry district of the State is delineated.

The following statement gives the figures relating to every district in which the number registered exceeds 100:—

E.

District,			Number,	District,		Number,
Brisbane	 		1,427	Enoggera	 	 190
Toowoomba	 		372	Warwick	 	 176
Ipswich	 .,,		294	Bundaberg	 	 156
Rockhampton	 		275	Mackay	 	 141
Townsville	 ***		220	Gympie	 	 136
Maryborough	 	***	200	Cairns	 	 124
Kennedy	 		192			

There were 5,169 marriages celebrated in Queensland last year, against 4,769 in 1910—an increase in the former year of 400. Of all marriages, 1,427, or 27.6 per cent., were celebrated in the metropolitan district; whilst the remaining 12 districts named in the foregoing statement accounted for 2,476, or 47.9 per cent., leaving 1,266 marriages the celebration of which was distributed throughout the 36 other districts of the State.

MARRIAGE RATE.

The marriage rate for 1911 of 8.41 per 1,000 of the mean population can only be considered most satisfactory as evidencing the general prosperity of the community. The following table shows the marriage rate for each year since the establishment of civil registration in 1857:—

Ea.

			La.		
Year.	Number of Marriages per 1,000 mean Population.	Year.	Number of Marriages per 1,000 mean Population.	Year.	Number of Marriages per 1,000 mean Population.
1857	8.2	1876	7.6	1895	6.2
1858	9.4	1877	7.6	1896	6.1
1859	9.3	1878	7.0	1897	6.0
1860	10.8	1879	7.5	1898	6.0
1861	10.2	1880	7.0	1899	6.8
1862	14.4	1881	7.7	1900	6.9
1863	14.5	1882	8.6	1901	6.6
1864	14.0	1883	8.9	1902	6.3
1865	13.3	1884	8.9	1903	5.7
1866	11.6	1885	8.9	1904	5.9
1867	9.5	1886	8.3	1905	6.04
1868	8.3	1887	8.2	1906	6.73
1869	8.3	1888	8.7	1907	7.58
1870	7.8	1889	7.9	1908	7.22
1871	8.1	1890	7.8	1909	7 95
1872	8.7	1891	7.1	1910	8.02
1873	9.6	1892	6.7	1911	8.41
1874	8.6	1893	5.9		
1875	8.6	1894	5.7		

From an inspection of this table it will be seen that, although much higher rates obtained at one time during the period—notably in 1860-66—and slightly higher than the 1911 rate on several other occasions, yet the marriage rate of $8\frac{1}{2}$ per 1,000 was more than an average one for Queensland. During the early sixties a system of Government-aided immigration was in full operation, and large numbers of young adults of both sexes were constantly being added to a comparatively small population. The consequence was that during seven years marriage rates ranging from 10.2 to 14.5 were recorded, but such a high ratio could not be possibly maintained when the age condition of the people reverted to a normal state.

Compared with the rest of Australasia, Queensland occupies not quite a half-way position as regards marriage frequency.

			E).

	7·84 7·68 7·94 8·02 7·91	7.58 7.84 7.68 7.94 8.02 7.91	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	1907. 1908. 7·58 7·22 7·84 7·96 7·94 7·84 7·90 7·91 7·87 8·91 8·82	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	1907. 1908. 1909. 7·58 7·22 7·95 7·84 7·96 8·03 7·68 7·38 7·35 7·94 7·84 8·00 8·02 7·50 7·27 7·91 7·87 8·13	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	$\begin{array}{cccccccccccccccccccccccccccccccccccc$

For both 1911 and for the mean of the last 5 years, Queensland stood fifth for the whole of Australasia and fourth of the seven States of the Commonwealth.

The foregoing rates are crude rates only—that is to say, they are the rates based on the mean population, and not on the number of marriageable persons available. The latter would suggest itself as an important factor in the case; but experience hardly shows that it does so to the extent that might reasonably be expected. Obviously, in a community only comprising married adults and children there could be no marriages, and it follows that with only a limited number of marriageable persons of either sex the ratio of marriages to the total population must be a low one. Experience, however, fails to show that the marriage rate is much influenced unless the disproportion of marriageable persons is pronounced, whilst considerable difference as to the available numbers of either sex do not appear to affect the result.

		Ec.			
			Males.	Females.	Persons.
Queensland			18.57	 13.86	 32.43
New South Wales	 ,		16.22	 15.35	 31.57
Victoria	 		15.30	 18.75	 34.05
South Australia	 		15.02	 16.92	 31.94
Western Australia	 		21.20	 11.18	 32.38
Tasmania	 		13.70	 15.40	 29.10

It will be noted that the available ratio number of both sexes only varies from 29.10 in Tasmania to 34.05 in Victoria, but the average marriage rate for 5 years was greater in the former State than in the latter, although the same did not apply to the experience for 1911. Tasmania was exceeded as to the number of marriageable persons by several States with a lower marriage rate.

Considerably greater variation is found when the numbers of marriageable males and females are considered; and Western Australia, where there are two single men to every single woman, has a low marriage rate, as did both Victoria and Tasmania both with single women in the majority. In New South Wales, where single men were relatively the more numerous, the rate was considerably higher; but the best ratio was obtained in South Australia, where there were nearly 2 more marriageable women than men in each 100 of the population.

MARRIAGE BY RELIGIOUS DENOMINATION.

The following table shows for each of 10 years the number of marriages celebrated by each of the principal religious bodies, and also the aggregate number so celebrated by each for that period:—

6	Ser.	T	1

Denomination	1.	1902.	1903.	1904.	1905.	1906.	1907.	1908.	1909.	1910.	1911.	Total Ten Years
Church of England		 883	741	789	779	877	1,057	1,021	1,148	1,212	I,448	9,955
Roman Catholic Church		 645	589	619	616	767	827	792	918	941	1,042	7,756
Presbyterian		 445	441	444	427	487	577	554	621	683	712	5,391

Salvation Army		 16	9	21	15	17	23	35	36	32	34	238
Other Christian Sects		 93	84	124	139	169	220	234	354	245	235	1,897
Hebrew		 	1	1	1	3		2		4	6	18
By Registrars and Marryi	ng Justices	 230	200	159	188	183	219	187	198	205	220	1,989
Totals		 3,243	2,933	3,078	3,173	3,588	4,105	4,009	4,542	4,769	5,169	38,609

Of the 5,169 and 38,609 marriages celebrated during 1911 and during the decennium ending with that year respectively, 1,448 and 9,955 were celebrated according to the rites of the Church of England; 1,042 and 7,756 by clergy of the Roman Catholic Church; 712 and 5,391 by Presbyterian ministers; and 947 and 6,759 by Methodists.

Fuller details on this are given in Appendix, Table No. V.

A great many persons are married by other ministers than those of the church to which they profess to belong. With mixed marriages this obviously must be so as regards one of the parties; but the differences in some instances between the marriage and the census figures are too great to be thus explained, as will be seen from the following statement:-

1	03	
ula .	Cus	

		T.	a.				om annog
			Propor	tion per cent.	each Denomination	to total—	
				Population. Census, 1911.		Marriages, 1911.	
Church of England	 		***	35.11		28.01	
Roman Catholic Church	 			22.63		20.16	
Presbyterian Church	 			12.47	•••	13.77	
Methodist Church	 			9.89		18.32	
Lutheran Church	 			4.00		3.10	
Baptist Church	 			2.26		4.39	
Congregational Church	 			1.72		2.67	

Thus, whilst 35 per cent. of the people of Queensland returned themselves as members of the Church of England, at the last census only 28 per cent. of all marriages were celebrated according to its rites, 23 per cent. of the people were entered on the schedules as Roman Catholics, and 20 per cent. of the marriages were celebrated by clergy of that church. Presbyterians numbered 12 per cent.; and returned 14 per cent. of the marriages; and Methodists comprised 10 per cent. of the population, and recorded 18 per cent. of the marriages.

Birthplaces of Persons Married.

The country of birth of each person married last year in each registry district is recorded at Table No. VI. in the Appendix. As two-thirds of the persons married are natives of Queensland, and four-fifths are natives of the Commonwealth, this information does not possess the interest that at one time attached to it. In 1875 only 7 per cent. of persons married were born in this State; consequently at that time a good deal of interest attached to the nationality of persons married.

Ages of Husbands and Wives.

Full information on this subject will be found in Appendix, Table No. VII. An analysis of this table is furnished by the following statement:-

Т	otals			 	5,169	207	96	128	219	256	415	412	452	463	444	2,077

Of the 5,169 husbands married last year, 153 were under 21 years of age. Of these, 57 married brides younger than themselves, 28 took wives of the same age, whilst 68 were united to older women. Eleven of the latter were upwards of 5 years older than their husbands. Men between 21 and 30 comprised 3,276, or 63 per cent. of all husbands. Those between 30 and 40 years of age numbered 1,296, and between 40 and 50 years of age numbered 304, only 140 husbands being upwards of 50 years of age.

The age range for males extended from 16 years to 79 years. At both ages—fortunately, at least, as to the boy—there was only 1 husband; but of 17 years of age there were 2, and of 18 years of age 16.

The record as to women extended from 14 to 78 years of age. Two children of 14 became wives, 10 of 15, 54 of 16 years, 143 of 17, and 263 of 18 years of age. Instances of great disparity included the following:—Old men of 76, 74, and 73 to girls of 20, 24, and 21 respectively. One man of 45 was married to a child of 16. On the other hand, young men of 21, 23, and 26 took as wives respectively women of 41, 45, 47, and 52; thus in the last instance quoted the bride was exactly twice the age of her spouse.

The mean age at marriage shows but little variation from year to year.

The following statement gives the average for 1911, and the average of the means for certain year groups since 1881:—

				Ga.			
				All Husbands.	Bachelors.	All Wives.	Spinsters.
1881-1885,	Average	of	Means	 28.22		23.29	
1886-1890,	,,	,,	,,	 27.52		23.23	
1891-1895,	"	,,	,,	 28.38		23.69	
1896-1900,	,,	,,	,,	 28.91	27.79	24.22	23.22
1901-1905,	,,	,,	,,	 29.15	28.07	24.43	23.39
1906-1910,	,,	,,	,,	 28.87	27.83	24.51	23.58
1911	Mean a			 28.82	27.76	24.71	23.84

The particulars are furnished for all husbands and wives and also for first marriages only. Bachelors and spinsters average about one year younger than all husbands or all wives. The mean ages at marriage for 1911 were—All husbands, 28.82; bachelors, 27.76; all wives, 24.71; spinsters, 23.84. The corresponding figures for 1910 were 28.83, 27.73, 24.71, and 23.73. Husbands average about 4 years older than their wives.

Conjugal Condition of Husbands and Wives.

Re-marriage as to both husband and wife relatively to the total number of persons married was fairly constant during the last two years such marriages comprised $12\frac{1}{2}$ per cent. of the total,

	Widows						294	5.69	***	38.96		
	Divorced	Women	١				6	0.11		35.33		
TOTAL PERSONS	MARRIE	D					10,338	200.00	28.82	24.71		

Of husbands, 93.42 per cent. were bachelors, 6.27 per cent. were widowers, and 0.31 per cent. were divorced. The mean age of the bachelors was 27.76 years; of the widowers, 44.29; and of the divorced, 37.50 years.

Of the 5,169 wives, 4,869, or 94.20 per cent., were spinsters; 294, or 5.69 per cent., were widows; and 6, or 0.11 per cent., had been divorced.

During the past 10 years there has been a considerable increase in the number of dissolutions of marriage granted, and also in the number of divorced persons re-married.

Gc.

	1902.	1903.	1904.	1905.	1906.	1907.	1908.	1909.	1910.	1911.
Dissolutions	 6	8	13	4	12	12	11	16	20	27
Divorcees Remarried	 14	12	9	8	9	18	10	15	26	22

The 27 dissolutions granted in 1911 represents 54 persons set free, and 22 persons who had been divorced were remarried during that year. There is not, of course, any necessary connection between the two sets of figures; nevertheless, the figures for a series of years may not unreasonably be taken as indicating in some degree the practice with regard to re-marriage on the part of divorced persons.

During the 10 years reviewed in the table, 129 dissolutions were granted, thus releasing 258 persons. Re-marriages of divorced persons numbered 143—a number a little in excess of half of that of those divorced.

Persons Signing Marriage Register by Mark.

The degree of education existing is such that it is very rare now to find persons so illiterate as to be quite unable to sign their name in some fashion. Less than 1 in each 100 persons married were so circumstanced last year.

I.

							Proportion to each 100.

1911		37		48	• • •	0.72		0.93		0.82				

The above table, which covers a period of 37 years, shows clearly the improvement that has taken place during that time.

BIRTHS.

Although still leaving something to be desired, the position with regard to births was more satisfactory in 1911 than had been the case in recent years. The first three tables in the Appendix give full details as to the births which took place in 1911. They numbered 16,991, comprising 8,707 males and 8,284 females. This is the largest number recorded in any year since the establishment of registration in 1856. It exceeded the registration for 1910 by 818, a centesimal increase of 5.06, which was greater than for any year since 1904.

Total	8,261	7,912	16,173	8,707	8,284	16,991	818	95.78	95.14

There were increases recorded in each division except Edgecumbe, York Peninsula, and Carpentaria, where small decreases were returned. The sex ratios were nearly the same for each year, although in 1911 there was a slightly larger proportion of male children born. On small numbers for a single year the rule as to the preponderance of males is frequently accepted generally to be followed by a complete swing of the pendulum in the following year. This may be seen in the Carpentaria and South Western Divisions, where in 1910 ratios of female to male births of 106.34 and 110.48 respectively were followed in 1911 by ratios of 82.47 and 92.13. However, in the suburban section of the Metropolitan Division an unusual disproportion of sex was experienced during the two consecutive years; the ratios of females to males being—1910, 116.00; and 1911, 129.73. These proportions are on limited numbers only, but even allowing for this the record seems somewhat unusual. The proportions of female to male births for each of the past 10 years were as follows:—

					Jb.						
1000				ales born t 00 males b				Females born to ever 100 males born.			
1902		***		95.30		1907			95.09		
1903				96.37		1908	 		93.20		
1904				97.39		1909	 		95.50		
		•••		95.27		1910	 		95.78		
1906			•••	92.57		1911	 	•••	95.14		

The birth rate—i.e., the number of births per 1,000 of the mean population—last year was 27.7 against 27.3 in the previous year, a ratio that has not been exceeded since 1901.

			K.			
1860	 47.9	1880		36.9	1900	30.2
1865	 43.6	1885				25.9
1870	 43.5	1890				27.3
1875	 37.5	1895				27.66
						 ~ 00

The rate for the whole State thus shows considerable improvement on the figures for recent years, but from the above table it will be seen that it falls much below the proportions at one time obtaining.

Whilst Queensland showed improvement as to birth rate last year, other States advanced still more; so that this State can hardly be considered to compare favourably with the rest of Australasia.

Western Australia 29·24 28·90 27·66 26·85 28·22 28·17 Tasmania 29·68 30·89 29·90 29·87 28·61 29·79 New Zealand 27·30 27·45 27·29 26·17 25·97 26·84			26·87 27·14 25·16 23·82 29·24 29·68	1908. 26·71 26·77 24·58 24·59 28·90 30·89	1909. 27·24 26·94 24·57 24·57 27·66 29·90	1910. 27·31 27·32 24·04 25·11 26·85 29·87	28.61	quinquennial perio 27:16 27:40 24:64 25:00 28:17 29:79
---	--	--	--	---	---	---	-------	--

Though Queensland's ratio of 27.66 exceeded that for Victoria (24.86), New Zealand (25.97), and South Australia (26.89), yet it was surpassed by Western Australia (28.22), Tasmania (28.61), and New South Wales (28.84). It can, however, be said that the difference between the average of the three excess (28.56) is considerably less than the difference between the average of the three minus numbers (25.84)—namely, plus 0.90, and minus 1.82 per cent., respectively.

The crude birth rate—i.e., the proportion of births to the total population—is, of course, much influenced by the age, the sex, and the conjugal conditions of the people. One of the truest tests as to the improvement or decadence with respect to natural increase is the proportion of births to the number of women of child-bearing age. This information can only be compiled at census periods, as it is only then that the ages of the community can be ascertained with any measure of accuracy.

The census of 1911 afforded the opportunity of recording up-to-date data.

Kb.

Census Year.			ARS TO 45 YEARS AGE.	BIR	THS,		BIRTHS PER 1,000.

		1			02			

From the figures furnished in the statement it may be inferred that, although the rate of natural increase is still on the decline, yet the speed at which such decline was proceeding has somewhat moderated. Measured by the test afforded by this table, it appears that, whilst in 1861 every 1,000 women between 15 and 45 years gave birth to 246 children; in 1911—just 50 years later—the same number only bore 126 children, or but little more than half the 1861 experience. If the figures in the last column of the table are viewed, the gradual decline to this result at each census becomes at once apparent. Each 1,000 women of child-bearing age—15 to 45—in 1861 bore 246 children; in 1871, 233; in 1881, 207; in 1891, 186; in 1901, 137; and now in 1911 only 126.

Illegitimate Births.

In quoting figures for illegitimacy, it has to be remembered that they only relate to known and recorded illegitimacy. The experience of all registration offices, I am sure, must lead to the conclusion that many children registered as legitimate are not born in wedlock, and there is good reason for thinking that the recorded figures are not even approximate.

			I.					
				Males.		Females.	Persons.	
First Quarter			 	141		123	 264	
Second Quarter			 	123		134	 257	
Third Quarter			 	141		153	 294	
Fourth Quarter		400	 	132	000	141	 273	
9								
T	otal		 	537		551	 1,088	

There were 1,088 children returned as born out of wedlock—537 males and 551 females; the latter thus proving the more numerous. The ratios for 10 years of illegitimate to legitimate births were as follow:—

			La	l o			
1902	6.04	1906		7.68	1910	,	6.37
	6.79	1907			1911		6.40
1904		1908		7.45			
1905		1909		6.99			

From these figures there does not appear to be any considerable increase of illegitimacy during the decade—indeed, the last two years of the period witnessed some decline—although this may perhaps be in part explained by the operation of "The Infant Life Protection Act of 1905." Queensland, unfortunately, stands at the head of the list of the Australian States with regard to births out of wedlock.

Legitimation.

By "The Legitimation Act of 1899" a child born before the marriage of its parents shall, if they thereafter intermarry, be deemed on registration legitimate from birth, provided there was no legal impediment to such marriage at the time of the birth. Registration can only be effected on the statutory declaration of the father.

Since the passing of this Act there have been 1,191 children legitimated thereunder. following are the particulars:-

												c.

Out of 16,816 confinements last year, 173 were multiple, a centesimal ratio of 1.03; the corresponding ratio for 1910 was 0.92.

DEATHS.

The mortality experience for 1911 was a little less satisfactory than that for several preceding years, due to a relatively larger number of deaths among adults, as deaths of the very young did not show any great increase in number, although the mortality with children of 5 to 10 years of age was considerably above normal, the causes being distributed widely throughout the classification, although scarlet fever, diphtheria, tetanus, and Bright's disease were prominent contributors to the increase.

The following table gives the information for 10 years as to the numerical and proportional mortality:-M.

	 terior productional ratios in against anno	-

There were 4,060 male deaths, 2,484 female deaths, giving a total of 6,544 deaths recorded last year; in both cases this was a greater number than for any other year of the decade.

The death rates for 1911 of 12.14 for males, 8.88 for females, and 10.65 for persons were all more favourable than those for either 1902 or 1903.

Although a comparison of the death rates of the various States of the Commonwealth for 1911 is hardly favourable to Queensland, yet if a large period be considered this is not the case.

- 49	100	m	80		
- 1	w	m		n	
-	м	ш	ь.	a	ь.

Queensland	Rate in 1907.	Rate in 1908.	Rate in 1909. 9:68	Rate in 1910.	Rate in 1911.	Average of the Rates for the Quinquennial Period.
New South Wales Victoria South Australia	10·56 11·66	10·13 12·46	9·75 11·24	9.70 9.71 11.27	10.65 10.39 11.45	10·12 10·11 11·62
Western Australia Tasmania	9 87 11·09 11·22	9·84 10·74 11·71	9·37 9·85 10·01	9.72 9.71 11.35	9·82 10·20 10·15	9.72 10.32 10.89
New Zealand	10.95	9.57	9.22	9.71	9.39	9.77

For 1911 Queensland's death rate of 10.65 was only exceeded by that of Victoria (11.45), being in excess of those for South Australia (9.82), Tasmania (10.15), Western Australia (10.20), and New South Wales (10.39). The averages of the rates for the quinquennium were—South Australia, 9.72; New South Wales, 10.11; Queensland, 10.12; Western Australia, 10.32; Tasmania, 10.89; and Victoria, 11.62.

Mortality Index.

The recent census has afforded an opportunity for correcting on an approximately reliable basis the adjustment laid down by the Conference of International Statisticians so as to bring the age condition of Queensland's population in line to enable an equitable comparison to be made of death rates. It is evident that the adjustments made in recent years based on the distant census of 1901 have been adverse to this State, evolving a too high mortality index out of the crude death rate.

IMI b.

Year.	Classes of Age.	°/o of Queens- land Population at each Age Period, Census 1911.	Estimated Mean Population.	Number of Deaths.	Coefficient °/o.	°/o of Swedish Population at each Age Period.	Queensland Index °/co.
1911	1 to 20 years 20 to 40 ,,	2:69 40:97 32:77 17:77 ds 5:80	16,526 251,700 201,323 109,170 35,633	1,112 882 1,099 1,451 2,000	6.73 0.35 0.55 1.33 5.61	2·55 39·80 26·96 19·23 11·46	1.72 1.39 1.47 2.56 6.43
	Totals	100.00	614,352	6,544	1.07	100.00	13.57

Thus in 1910 with a crude death rate of 9.70 per 1,000 of the population, this was corrected to a mortality index of 13.98. With the more reliable data as to age of population afforded by the recent census, the higher crude death rate for 1911 of 10.65 becomes adjusted to a mortality index of 13.57.

Ages at Death.

Full information on this point will be found in several tables of the Appendix as well as in the next seven summary tables included in the body of this report.

The following table, which supplied the data upon which the mortality index was framed, gives some information as to ages at death in a concise form:—

N.

Quanton	Under 1 Year.		1 and under 5 Years.		5 and under 20 Years.		20 and under 40 Years.		40 and under 60 Years.		60 Years and upwards.		Males.	Females.	Persons

Total Persons	1,1	112	4	130	4	152	1,0	094	1,4	144	2,6	012	, .		6,544
Percentage each Age Group to	15.32	19.73	5:30	8:66	5.96	8:45	16:43	17:19	24.95	17:35	32.04	28.62		100.00	
Total each to each	16	99	6	57	6	91	16	72	22	07	30	74		100.00	

Of the 6,544 persons who died last year, 1,112, or 17 per cent. of the total, were infants of under 1 year of age; 430, or 6 per cent., were between 1 and 5 years of age; 452, or 7 per cent., were between the latter age and 20 years. Between 20 and 60 years 2,538, or 39 per cent., died; and those over 60 years of age comprised 2,012, or 31 per cent. of the total.

On reviewing the proportions to all deaths contributed by those of the age groups given, it is found that the mortality among females—infants, children, and youths—is much greater than with males; whilst, having once attained the age of 40, women contribute much less to the deaths. Practically one-fifth of all female deaths were of infants under 1 year; the ratio with males was 15 per cent. only. From 1 to 5 years the proportions were 9 for females, 5 for males. From 5 to 20 years the figures were 8 to 6, from 20 to 40 they were 17 to 16, and from 40 and upwards 46 for females and 57 for males.

True Infantile Mortality.

The ages of persons living, which is obviously such an important factor in connection with mortality, can only be accurately determined for the whole population at or closely after a census enumeration; but for—so far as death is concerned—a very important portion of the population—namely, for infants under 1 year of age—the number of births affords a very reliable method of gauging the number living at that age. The ratio of infant mortality can, therefore, be at any time measured with a great degree of accuracy.

The deaths of infants are, unfortunately, so numerous as to render the recording of a centesimal ratio rather than a millenial one.

O. SHOWING TRUE INFANTILE MORTALITY.—RETURN FOR TEN YEARS.

1902.	1903.	1904.	1905.	1906.	1907.	1908.	1909.	1910.	1911.	Mean for the 10 years.
10.02	11.99	7.61	7:55	7:47	7-72	7.03	7-19	6-31	6.54	7:84

During the 10 years reviewed, the true infant mortality—that is, the proportion of deaths of infants under 1 year to each 100 of the births—ranged from 11.99 in 1903 to 6.31 in 1910. Last year the ratio was 6.54—slightly higher than that in 1910, but considerably below that of any other year of the decennium or, indeed, of any other year of the history of registration in Queensland.

With such a wide margin of fluctuation in the yearly rates, records for a more extended period obviously afford a more equitable method of determining the true mortality. To this end the mean rate for the whole of the 10 years is furnished in the last column of the foregoing table. The following statement gives by quinquennial rests the decimal rate of true infant mortality since 1875:—

				oa.			
1875	***	***	12.46		1900	***	 10.31
1880		***	12.98		1905		 9.89
1885			13.64		1910		 8.23
1890			12.65		1911		7.84
			11.07				

The great improvement that has taken place during the last 20 years is at once apparent. The rate of 12.65 obtaining during the decennium ending 1890 was, it will be seen, rather below the averages of previous experiences, but was in excess of that for the last decade—7.84—by 62 per cent.

The true infant mortality for Queensland compares well with that for other States.

		(Ob.				
Queensland						***	1911. 6·54
New South Wales							6.25
Victoria							6.87
South Australia Western Australia			***				6·05 7·62
m				***	***	***	7.40
New Zealand	***			***		***	5.63

These figures speak for themselves, and entirely refute the statement sometimes made that the tropical character of the Queensland climate is inimical to infant life.

The following table is designed to facilitate a deduction as to the mortality of children in such districts of the State as contain the chief centres of population, and thus to enable a comparison to be drawn between those districts:—

						4	· .					
						Dis-	CHILDREN UN	DER 2 YEA	ES OF AGE.	CHILDREN UNI	DER 5 YEA	ES OF AGI
	R	egistry	District.			Number of Deaths in trict,	Gensus 1911— Gentesimal Eatho of Children under 2 years of age to Population of District. Obviously, if the population of any district contained few children, the latter would not be likely to contribute largely to the general death rate. Columns 3 and 6 give the ratio district by district of children under 2 years of age and under 5 in the total population as determined by the recent census. Children under 2 ranged from 4.39 per cent. in Brisbane to 6.47 per cent. in Mount Morgan; the ratio for the whole State being 5.21. The ratios of deaths of such children to the total deaths ranged from 11.18 per cent. in Townsville to 32.00 per cent. in Mount Morgan. The latter district, it is true, contained the largest number of children of this age; but still its mortality ratio was out of all proportion to its population excess.

Again, Enoggera, with relatively fewer children under 2 than the average for the State, had a death rate of such children more than 50 per cent. above the State average. Other districts with population ratios below and death ratios above the State averages were—Ipswich, 5.05 and 22.50; and Rockhampton, 5.05 and 21.93. Toowoomba, whose population proportion (5.31) slightly exceeds that for the State, yet had a mortality ratio much in excess of the latter—namely, 25.61 per cent.

The bulk of deaths under 5 years of age are comprised in those under 2, there having been last year 1,296 of the latter out of 1,542 of the former; therefore, the ratios under 2 years control those under 5 years. All children under 5 have a mortality nearly twice as great as that for the whole population, seeing that such children contribute 12.17 per cent. of the population and 23.56 per cent. of the deaths.

The death rate at different ages is a very important phase of mortality statistics, and can only be accurately ascertained for census years, and it is only then that the population numbers at each age are available.

The following table, the information in which as the census date recedes becomes approximate only, presents for 1911 very exact data:—

				Q			
				Proportion of Population at each Ag	e lation 1911 at each	Des	ths, 1911.

As showing for true infant mortality purposes how closely the births represent the infant population, it may be noted that, based on the figures ascertained by the recent census, the mean population of infants under 1 year for 1911 was 16,526, whilst the number of births for that year was 16,991, a proportional difference of not quite 3 per cent., and one that would only change the infant mortality from 6.54 to 6.73, a variation of 19-100ths only.

The death rates per 1,000 during each of the first five years of life were 67, 12, 8, 5, and 4 respectively; the average for all under 5 years of age being 21 deaths per 1,000 of population—a rate not again reached for any quinquennial period until the ages of 55 to 60 were reached.

The following table giving the number of deaths for every year since Separation for the different ages was compiled for a special purpose some time ago. It has now grown somewhat cumbersome, but is found so useful for actuarial work that it is proposed in future to transfer it to the Appendix as a permanent cumulative table:—

0	a.

Of the 6,544 total deaths last year, 1,112 were of infants and 1,542 of children under 5 years of age. The last two columns give the mean age at death year by year, and the mean age of all persons living at each census. A study of these two columns shows how the expectation of life has advanced since 1860. In 1861 the mean age of all persons living was 23, and the mean age at death was 22; last year the corresponding figures were 26 and 40 respectively.

Birthplaces of Persons Dying.

The following table gives the population proportions and the death numbers and proportions of persons of differing nationality, using that word in its actual and not political sense:—

		Pop	imal Proportion to Total culation borne by each conality, Census of 1911.	Total Deaths 1	esimal Proportion to borne by Deaths of by, Year 1911.
011			Proportion.	Number.	Proportion.

			Department of the Control of the Con	Electricular Misses	
			100.00	6,544	100.00

Full details are given in Table No. XI. in the Appendix; thus 74 per cent. of the population were Australian by birth, and these contributed 49 per cent. of all deaths. Natives of the United Kingdom comprised 20 per cent. of the population, and provided 40 per cent. of the deaths. The only other nationality strongly represented are people from Germany. Citizens of German extraction are numerous, but by actual birth less than 2 per cent. hail from that country. These contributed to the deaths in about the same proportion to their population numbers as natives of the United Kingdom.

Occupations of Persons Dying.

The following table summarises certain information contained in Appendix Table No. XII.:-

Ra.

When the numbers of persons engaged in each industry as entered on the census schedules are tabulated, valuable deductions may be determined from the mortality statistics as to the healthfulness of given occupation. In the meantime the deaths only are available. Of the 6,544 persons who died last year, 964 were engaged in agriculture and 962 in industrial pursuits, 316 in transport and 241 in commercial undertakings.

Metropolitan Deaths and Death Rate.

The salubrity of the Brisbane climate will compare not unfavourably probably with any city of like size in the world, as consideration of the following figures in conjunction with the explanation now offered will be readily shown:—

			E D.			Estimated Mean Population.	Total Deaths.	Rate per 1,000.
City of Brisbane						4 0,254	833	*20.69
City of South Brisbane						30,874	421	13.64
Suburbs						71,300	475	6.66
Brisbane Metropol	itan	Area (Ten-mile	Radius)	142,428	1,729	12.14
State	, .					614,352	6,544	10.65
	val and	Children	's Hospitals	are in the	City	of Brisbane.		

The death rate for Greater Brisbane last year was only 12.14 per 1,000 of the population against 10.65 for the whole State. This is very satisfactory when the following facts are considered:—Deaths in public institutions such as hospitals, etc., the inmates of which are drawn from all over the State, centributed more than one-third of all deaths. The population includes a considerably larger proportion of young children than the average for the whole State. Many sick persons from outside are moved to the homes of relatives in the city for facility of nursing and medical attendance. A large number of private hospitals also draw many of their patients from beyond the city limits. When all these facts are given due weight, one can only be surprised at the smallness of the death rate.

The very low rate obtaining in the suburbs is, of course, explained by the removal often in extremis of sick persons to one of the institutions in the centre of the city.

Deaths in Public Institutions in Brisbane.

It has already been said that deaths in public institutions within the metropolitan area comprised one-third of all the deaths recorded within such boundary.

Some of the figures in the above table appear hard to reconcile. If the cost for each in-patient was only 3s. $7\frac{1}{2}$ d. per diem in Brisbane, why should so large a sum as 6s. $3\frac{3}{4}$ d. be required at Mount Morgan for similar service?

Causes of Death.

The scheme of classification adopted by this Bureau is "The Bertillon," as revised and adopted from time to time by the Conference of the International Institute of Statistics. This is the system now generally recognised, and thus the mortality statistics of all countries where it is in use are easily comparable one with the other.

A skeleton summary of this scheme with the figures for Queensland for five years tabulated therein is below:—

TABLE comparing the Percentage which the several Causes of Deaths bear to the Total Deaths in each Year.—Return for the Five Years.

TOTAL	100.00	100.00	100.00	100.00	100.00

Thus 26 per cent. of all deaths last year were attributed to general diseases; 14 per cent. were charged specifically to complaints of the circulatory system; 12 per cent. to diseases of the digestive system; and 10 per cent. to violence. This latter was the greatest number so recorded for any year of the last five.

In Appendix Table No. XIII. all the diseases which were the cause of any death last year are tabulated in the order of their degree of fatality.

The following table is a summary of a portion of the table for a period of years, giving particulars respecting a few of the more fatal diseases. Other tables later in the Appendix give a variety of information respecting the causes of mortality; and material from these will be used in some of my subsequent marks:—

RETURN for Five Years showing the Number of Deaths from some of the Principal Causes in Order of Degree of Fatality in 1911, also their Proportion per 10,000 of the Total Deaths and per 100,000 of the Mean Population, respectively, for each Year 1907-1911.

Organic Disease of the Heart.—Whatever the reason, there is no doubt that heart disease as a fatal complaint is increasing in frequency; 709 deaths were attributed to this cause last year, against 589 in 1910, 518 in 1909, 593 in 1908, and 468 in 1907. Heart diseases exceeded the next most fatal disease by 246, comprised nearly 11 per cent. of all deaths, and contributed a death rate of 1.15 per 1,000 of the mean population.

Diarrhæa and Enteritis.—There were 463 persons of all ages who succumbed to these complaints in 1911, although, of course, by far the greatest number consisted of young children; this was equal to 7 per cent. of all deaths, and contributed a death rate of 0.75.

Tuberculosis (All Parts).—Although tuberculosis is a general disease, its attacks are chiefly directed to the respiratory system. Phthisis (pulmonary tuberculosis) was for many years the most fatal of all diseases, and now this complaint, plus tuberculosis of all parts of the body, only stands third on the list of degree of fatality, evidencing a diminution in the frequency and virulence of this still, nevertheless, very terrible complaint. There were 414 deaths returned as due to tuberculosis in 1911, which was somewhat in excess of the numbers for quite recent years. Further particulars respecting tuberculosis are furnished in the following tables:—

Of the 414 deaths from this cause, 366 related to the respiratory system (pulmonary and laryngeal organs).

No less than 17 of the 366 deaths tabulated in Table Tb had a residence in the State of less than two years, 10 of them were of less than one year and 5 of less than six months' residence. Of the 17, no less than 15 were born elsewhere than in Australia. These facts point to the conclusion that persons not desirable on the score of health have been recently arriving in this State. It is satisfactory to note that, whilst some two-thirds of the total population are native-born Australians, these only contributed 150 deaths, less than one-third of the total deaths due to tuberculosis of the respiratory organs; 12 of the deaths were of Pacific Islanders, a race peculiarly prone to attack, and with whom it speedily proves fatal.

Table Tc deals with cases of tuberculosis of other organs. These numbered 48, comprising 35 native-born Australians and a considerable proportion of persons of short duration of residence in Queensland. This, of course, is explained by the fact that the seat of attack next to the lungs of most frequent occurrence is the digestive system; and young children, as large consumers of cows' milk, are those most frequently attacked, and these have necessarily only resided a short time in Australia.

Cancer.—There were 398 deaths returned as caused by cancer during 1911. The numbers for the previous four years were—1910, 395; 1909, 341; 1908, 337; and 1907, 353; so that, although cancer has fallen to fourth place on the list of fatality, this was not due to any decrease of the complaint, but to a general increase with respect to other diseases.

Further information is furnished in the following table:—

It will be seen from the foregoing table that cancer is essentially a disease of middle life and old age. Double figures were not reached for any quinquennial period before the 40th year, only 23 deaths having resulted from this cause up to that age. From 40 to 45 there were 21 deaths, the numbers for each succeeding five years being 35, 60, 48, 52, 81, and 37; after 75 years of age the deaths were 41.

Of the 398 deaths, 242 were of males and 156 of females, so that it is much more prevalent with the former than with the latter; indeed, except for attacks on the generative and mammary organs—for which special reasons are patent—it is not with females, comparatively speaking, a frequent cause of death.

With males the organ most frequently affected is the stomach. Last year 69 cases—including 10 of the pylorus—were thus locally ascribed, besides 7 cases in which the stomach was implicated with other organs. Other parts of the body peculiarly liable to be affected are—The liver, of which there were 27 cases, 15 males and 12 females, besides others in which the liver was implicated along with other organs; the tongue, 12 cases, all males. Cancer of the tongue is considered by many to be frequently induced by smoking. As already observed, the generative and mammary organs are most frequently the seat of attack with females. Cancer of the former either alone or implicated was returned as fatal in 31 cases, and of the latter there were 24 instances. Whilst, as already stated, there were 69 cases of deaths of males from cancer of the stomach, there were only 17 similar instances amongst females.

Congenital Debility, Icterus, and Scleroma.—The diseases of infancy are grouped together in the Bertillon classification, and were returned as causing 318 deaths in 1911. This was more than in any year of the preceding five. Besides the 318 deaths thus returned, there were 146 deaths from other diseases which affect the very young which may not unreasonably be included in the assertion that 464 infants were born non-viable. This fact of itself is grave enough, and would justify careful and systematic investigation as to the causes which produce such results, but an even more important side to the issue is the question: How many but little more physically fit than these infants, who it may perhaps be said fortunately did not survive, just succeeded in doing so in some instances to subsequently succumb after much suffering, in others to arrive at maturity incapable of producing healthy children, but unbarred from passing on all the misery and suffering they themselves have inherited to generations yet unborn?

Senile Debility.—There were 279 deaths thus certified. This is hardly a definite cause, but no doubt in many instances of extreme age it would hardly be possible even were a medical man in constant and close attendance prior to death to ascribe any other but something more definite suggests itself as practicable in deaths of persons not greatly beyond middle age. Thus 2 cases were so returned between 50 and 55, 3 between 55 and 60, 11 between 60 and 65, and no less than 31 between 65 and 70. Of the deaths, therefore, returned as due to senile decay, 47 of the parties had not attained to the three score and ten years which we are told are "the days of a man," leaving 232 to whose cause of death the term might seem less inaptly applied.

Bearing on this question of the death of old people, there were 732 persons who attained the age of 75 years—parenthetically it may be remarked that there were 447 deaths of persons 70 to 75; for 563, or 77 per cent., of these a definite cause of death was assigned, leaving only 169 to the indefinite term "senile debility." Further particulars as to the specific cause and to the year of age at death are furnished in the following table:—

General diseases, frequently of an epidemic character, but which for the most part are not fatal to children (not infants) or to young or middle-aged adults, figure to a considerable extent as causing the death of the old; thus 26 deaths were ascribed to influenza, 24 to diarrhea, etc.; and 15 to dengue. The circulatory system, however, stood easily first as the part that failed to sustain the burden of life. Organic heart disease caused 130 deaths; hemorrhage of brain and apoplexy, 38; disease of arteries, etc., 23; embolism, etc., 9. The respiratory system next proved unequal to the demand—Bronchitis, 67; pneumonia, 32; asthma, 9; congestion of the lungs, 8; whilst cancer, Bright's disease, and other complaints of the urinary system were also frequent contributors to the mortality.

Of the 732 who attained their 75th year, but little more than half had survived to another five years of age; whilst only 43 had reached their 90th year. Two of these were centenarians, both of them women; one died in her 101st and the other in her 102nd year.

Bright's disease (chronic) was returned last year as causing 232 deaths, besides which 45 deaths also resulted from acute nephritis. This disease (Bright's) is now much more frequently returned as a cause of death than was formerly the case, whether entirely due to increased frequency or partly to change of diagnosis is doubtful. At one time Bright's disease was largely considered a disease almost peculiar to the middle age; now it is recorded in relation to all ages of life. The mean age may still, however, be described as advanced middle life—1901, 47.54 years; 1906, 50.54 years; and 1911, 47.42 years; the constances of the mean age being brought about by an extension of the field of both earlier and later years of life.

Pneumonia.—Where this disease is a sequel of some other specific complaint, the originating cause is charged with the death and not the resultant hypostatic pneumonia. There were 229 deaths returned to pneumonia last year, a great increase on the figures of 1910, but approximately in accord with the experience of other recent years. The numbers for the past years were—-1907, 220; 1908, 215; 1909, 233; 1910, 149; and 1911, 229.

Drowning (Accident).—This, the most fatal of accidents, contributed no less than 212 cases to the death roll last year; the loss of the ill-fated "Yongala" being the largest contributor to this sad result.

Other causes, resulting in a number of deaths exceeding 100, were—Hemorrhage of brain, 187; and bronchitis, 181.

MARINE REGISTRATIONS.

Births and deaths on a ship voyaging to Queensland are by special statutory authority reported at the first port of call, and particulars forwarded for record in the General Registry Office in Brisbane. There were 2 births (both males) and 17 deaths—7 males and 10 females so registered last year. The births took place—1 on the "Rippingham Grange," and 1 on the "Torilla." Particulars of the 17 deaths were as follow.—"Meana," 1 female; "Orsova," 2 males; "Oswestry Grange," 1 female; "Remutaka," 1 female; "Rippingham Grange," 1 male; "Torilla," 2 males, 4 females; "Wyreema," 1 male; "Shinyomaru," 1 male; "Osterley," 1 female; and the "Perthshire," 2 females.

ADDITIONS TO REGISTERS.

There were 2,424 more names recorded in the registers in 1911 than in 1910; such registrations numbering in the former 33,892, and in the latter year 31,468. The number on record on the 31st December, 1911, was 990,691 names, or less than 10,000 short of $1,000,\overline{000}$; therefore, this figure must have been more than reached at the present period of the current year.

REGISTRY OFFICE.

Receipts and Payments to District Registrars.

The collections by district registrars for 1911 amounted to £1,159 9s. 9d.; of this, £540 9s. were collected in the metropolitan office. These figures represented increases over the receipts for 1910 of £50 8s. 3d. and £32 19s. 6d. respectively. The following statement gives the amounts for 1910 and 1911 for each district of importance:—

RETURN showing the Amounts received by the District Registrars in the State during the Years 1910 and 1911 respectively, and paid into the General Revenue.

District Regist	rars at—	-	19	910.		19)11.	i	District Registrars at -		19	910.		1	911.	
Brisbane Bundaberg Cairns Charters Towers Dalby Gympie Herberton Ipswich Mackay Maryborough			£ 507 23 16 37 7 26 10 49 22 46	17	d. 6 0 6 6 0 6 6 6	25 9 50 20	12 4 16	d. 0 0 0 0 0 0 0 6 6 6 9	Red Hill	-	60	6 10 11 11 0 6 7 13	d. 0 0 0 6 0 6 6 6 6 6	£ 9 34 63 8 58 56 19 128	5 10 14 11 15 19 7	d. 0 6 6 0 0 6 6 6

Ten years ago (1901) the collections were for the State £724–13s. 7d., and for Brisbane £297 3s. 9d.; so that the figures for 1911 represent increases of—State, 46; and Brisbane 82 per cent. each respectively.

Legislation in recent years has thrown a large amount of additional work upon the registry office, all of which is done gratuitously. The most of this—consisting of the making of searches and the issuing of certified copies for electoral (State and Federal), old age pensions, shop and factories, foreign consuls, etc., etc.—devolves upon the general registry office. If fees were collected for this work, I believe that a further sum of £300 would be added to the collections.

The amount paid to district registrars for their services for each of the past two years was as follows:—

RETURN showing the Amount of Salary or Fees Paid to District Registrars of the State during the Years 1910 and 1911 respectively.

- 98. Other Diseases of the Respiratory System.

CLASS V.-Diseases of the Digestive System.

- 99. Dis. of Mouth and associated organs.

- 99. Dis. of Mouth and associated organs.
 100. Diseases of the Pharynx.
 101. Diseases of the Esophagus.
 102. Ulcer of the Stomach.
 103. Other Dis. of Stomach (Cancer excluded).
 104. Diarrhea and Enteritis (under two years).
- 105. Diarrhea and Enteritis (over two years). 106. Ankylostomiasis.
- 107. Intestinal Parasites.
- 107a. Sprue.
- 108. Appendicitis.
 109. Hernia, Intestinal Obstruction.
- 110. Other Diseases of the Intestines.
- 111. Icterus Gravis.
- 112. Hydatid Tumours of the Liver.
- 113. Cirrhosis of the Liver.
- 114. Biliary Calculi.
 115. Other Diseases of the Liver.
- 116. Diseases of the Spleen.117. Simple Peritonitis (non-puerperal).
- 118. Other Diseases of the Digestive System.

CLASS VI.—Diseases of the Genito-Urinary System and Adnexa.

- 119. Acute Nephritis.120. Bright's Disease.
- 121. Chyluria.
- 122. Other Diseases of Kidney and Adnexa.
- 123. Calculi of Urinary System. 124. Diseases of the Bladder.
- 125. Other Dis. Urethra, Urinary Abscess, etc.
- 126. Diseases of the Prostate.
- 127. Non-venereal Dis. of Male Genital Organs.
- 128. Uterine Hæmorrhage (non-puerperal).
- 129. Uterine Tumour (non-cancerous)
- 130. Metritis and Other Diseases of the Uterus.
- 131. Cysts and other Ovarian Tumours.
- 132. Other Dis. of Female Genital Organs.
- 133. Non-puer. Dis. of Breast (Cancer excep.)

CLASS VII.-Puerperal Condition.

- 134. Accidents of Pregnancy.
 135. Puerperal Hæmorrhage.
 136. Other Accidents of Childbirth.
 137. Puerperal Septicæmia.
 138. Puerperal Abbuminuria and Eclampsia.
 139. Puerperal Phlegmasia Alba Dolens.
 140. Other Puerperal Accidents, Sudden Death.
 141. Puerperal Diseases of the Breast.

CLASS VIII.—Diseases of the Skin and of the Cellular Tissue.

- 142. Gangrene
- 143. Carbuncle.
- 144. Phlegmon, Acute Abscess.
- 145. Other Diseases of the Skin and Adnexa.

CLASS IX.-Diseases of the Organs of Locomotion.

- 146. Non-tuberculous Diseases of the Bones.
- 147. Arthritis and other Dis. of Joints.
- 148. Amputation.
- 149. Other Dis. of Organs of Locomotion.

CLASS X.-Malformations.

150. Congenital Malfor. (excl. of Stillborn).

CLASS XI.—Infancy.

- 151. Congenital Debility, Icterus, and Scleroma. 152. Other Dis. Pec. to Infancy (un. 3 mths). 153. Want of Care (Infants).

CLASS XII.-Old Age.

154. Senile Debility.

- CLASS XIII.-Violence.
- 155. Suicide by Poison.
- 156. Suicide by Asphyxia.157. Suicide by Hanging or Strangulation.158. Suicide by Drowning.
- 158. Stilled by Browning.
 159. Suicide by Firearms.
 160. Suicide by Cutting Instruments.
 161. Suicide by Precipitation from a Height.
 162. Suicide by Crushing.

- 163. Other Suicides. 164. Poison by Food.
- Vene. Creatures and other Acute Poisons. 165.
- 166. Incendiarism.
